### **DETAILED ACTION**

1. This action is in response to applicant's amendment received on December 17<sup>th</sup>, 2007.

### ***Drawings***

2. The drawings were received on December 17<sup>th</sup>, 2007. These drawings are accepted.

### ***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 17-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Green et al (5,645,209) for the same reasons set forth in paragraph 5 of the previous office action mailed September 14<sup>th</sup>, 2007.

Regarding the amendment to claim 17, the energy storage mechanism has a spring 1057 and a fluid in a cylinder (Fig. 94). The actuation mechanism has a valve 1027 that is operable to control the rate of release of the energy stored in the spring 1057. Note that actuating the trigger 1020 causes the spring 1057 to compress and then release the stored energy after the piston completes its stroke. The valve 1027 is also moved into contact with the pneumatic canister 1026 during actuation of trigger

1020. Therefore, actuation of the valve controls the rate of release of the spring 1057 (from a rate of zero to a rate of return to a pre-fired position).

***Allowable Subject Matter***

5. Claims 1 and 5-16 are allowable over the prior art of record.

***Response to Arguments***

6. Applicant's arguments filed December 17<sup>th</sup>, 2007 have been fully considered but they are not persuasive.

Applicant contends that Green provides no guidance or motivation for one skilled in the art to include an actuation mechanism comprising a valve wherein the valve is operable to control the rate of release of the energy stored in the spring of the energy storage mechanism. However, as discussed in the above rejection, actuation of the valve 1027 controls the rate of release of the spring 1057 (from a rate of zero to a rate of return to a pre-fired position). This is due to the spring compressing when the trigger 1020 has been actuated.

For the reasons above, the grounds of rejection are deemed proper.

***Conclusion***

7. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
